## 1 Introduction

Please use this adapted version of the full paper to provide the **1-2 page** abstract, please include details of the problem and a brief summary of your findings.

## 2 Problem Statement

This document allows you to easily include references [1, 2], equations, figures (see Figure 1) or anything else you desire into a clean and compact environment of LATEX. For example if you'd like to impress a date you can write the unsteady heat equation as

$$\frac{\partial V}{\partial t} - \alpha \left( \frac{\partial^2 V}{\partial x^2} + \frac{\partial^2 V}{\partial y^2} + \frac{\partial^2 V}{\partial z^2} \right) = 0$$

where  $x, y, z$  are the space dimensions and  $\alpha$  is a parameter. If you felt inclined you could define  $V$  as

$$V = y^2 z - \cos(0.1x)$$

for a non-exact solution. Computational fluid dynamics can be used to discretize the equations, apply boundary conditions and simulate the unsteady nature of the flow. An innovative method to simulate the heat equation could even be submitted to ICCFD7.
